                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This coding sequence was isolated from the CI-215 human glioma cell line. It was incorporated into an appropriate vector to transform Saccharomyces cerevisiae or Ecoli. Monomeric TGF-betal was purified, denatured and dissolved in 140ml 50mm Tris/HCl pH8. IM NaCl. 5mm EDTA 2mM reduced glutathione, 1mM oxidised glutathione and 33mM Chaps. After 72 hrs at 4 deg C, pH was adjusted to 2.5 and the mixture was conc. 10 times. The conc. soll was diluted to the original vol. with 10mM HCl and conc to a final vol of 10 ml. The supernatant from centrifugation at 5000g for 30 min contained disulphide-linked dimeri
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ρλ

The invention covers hybrid TGF-beta molecules consisting of parts of the human isoforms TGF-betal, TGF-beta2 and TGF-beta3 (see AAQ41599, AAQ41600 and AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. The hybrid molecules pronote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation

pPLMu yielded plasmid pPLMu.hTGF-beta 3. Non-soluble, monomeric TGF-beta 3 was recovered from E. coli LC 137/pPLMu.hTGF-beta 3 (DSM 5658) transformants. A biologically active, dimeric form of TGF-beta 3 was obtd. by refolding this monomer in detergent-free buffer cong. DMSO and/or DMF. Dimers of TGF-beta 1 (AAR92773) and TGF-beta 2 (AAR92774), and hybrid dimers (see also AAR92775), were
                                                                                                                                                                                                                                                                                                                                                                                                             180

```
This sequence represents the coding sequence for human transforming growth factor beta3 (TGF-beta3). TGF-beta3 is one of five distinct homodimeric TGFbeta3 is a acid-stable and heat-stable disulphide linked homodimer. All the TGF-beta's are produced as 390-412 amino acid precursors, which undergo proteolytic cleavage to produce to mature forms which consist of the C-terminal 112 amino acids. Depending upon cell and tissue type, and the presence of other growth factors.

TGF-beta may either stimulate mitogenesis, cell proliferation and growth, or inhibit these processes. Many of the actions of TGF-beta are related to the response of cells or tissues to stress or injury, and to the repair of resultant damage. A crystalline form of TGF-beta3 can be produced by a method of the invention. Crystalline TGF-beta3 is useful in the crystalline TGF-beta3 is useful in the second of the invention. Crystalline TGF-beta3 is useful in the crystalline TGF-beta3 is normally used. The crystalline form is also used for structure determination in rational drug design.

Crystalline TGF-beta3 shows lower tendency than the dissolved protein to adsorb on the walls of vials and is more stable against oxidation.

Variation of the properties, e.g. slze, of the crystals allows control over the rate at which active TGF is released in vivo.
                                                                                                                                                                                                                                                                                                                                                          veta-3 - useful in wound healing, and

Comprises a purification tag and a TGF active fragment. The present sequence encodes a specifically claimed TGF active fragment. The present sequence encodes a specifically claimed TGF active fragment.

Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the following elements: purification tag:proteinase site: TGF-beta promotes wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the fusion protein.

The proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the TGF-beta to the site to be calculated and reduces the amount of TGF-beta required to be administered to the fusion protein to the concentration of circulating TGF-beta

factor beta-3. Dimeric, biologically active TGF-beta-like protein can be produced by subjecting the denatured monomeric form to refolding conditions. The new monomeric S-sulphonated TGF-beta-like protein is useful for the production of the dimeric, biologically active TGF-beta-like protein, which is useful for the treatment of wounds (surface or internal) and cancer in a mammal, in bone and tissue repair, as a bone marrow protective agent, a mediator of cardioprotection, for the production of an anti-inflammatory or immunosuppressive preparation. Treatment is useful for animals,

fragment. The protein can be used in place of a bone morphogenetic active fragment to create the fusion proteins of the invention. When a bone morphogenetic active fragment is used, the fusion proteins are designated bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins are purification may contain some or all of the following elements: a purification tag, a proteinase site, an ECM/bone binding site, a second proteinase site, and a bone morphogenetic protein active fragment. The bone morphogenetic fusion proteins can be used for enhancing wound

                                                                             Gene product may be used to inhibit growth of tumour cells, to treat proliferative type disorders, burns and other wounds, and may also be used as an immune modulator. Detection of proteins and of TGF-alpha can indicate presence of a tumour.

Proteins may be produced from a bacterial or eukaryotic expression

                                                                                                                                                                                                                                                                              This 2529bp full-length TGF-beta3 gene sequence was obtained from three shorter overlapping clones derived from human placental, human umbilical cord and A673 cells cDNA libraries, respectively. The predicted amino acid sequence of the gene encoding TGF-beta3 shows extensive homology to TGF-beta 1 and beta 2. See also AAQ22229 and AAR20622.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 tacattgacttccgacaggatctgggctggaagtgggtccatgaacctaagggctactat 120

                                                                                                                                                                                      (TGF-beta3). The specification describes a composition for regulating trophoblast invasion which comprises an inhibitor of TGF-beta3, TGF-beta family cytokine receptors, hypoxia inducible factor 1 alpha (HF-1 alpha) or oxygen tension. The composition is used in methods of diagnosing, monitoring, preventing or treating conditions requiring regulation of trophoblast invasion, especially preeclempsia in pregnant

cDNA sequences were determined for human pre-TGF-beta-1 (AAQ56923), pig TGF-beta-3 (AAQ56925) and the corresponding amino acid sequences were determined (AAR4627-29, respectively). A genomic fragment corresponding to a human TGF-beta-1 exon (AAQ56924) was also isolated and its amino acid sequence determined (AAR46230). The sequences have been used in the construction of vectors for the expression of recombinant TGF-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            vectors which are replicated in bacteria and expressed in eukaryotic cells. TGF-beta recovered from transformed cells is used in known therapeutic applications. TGF-beta nucleic acids are also useful in diagnosis and identification of TGF-beta clones.
                                                                                                                                                                                                                                                                                                                                                                                                      This nucleotide sequence, hu4, codes for a human partial transforming growth factor-beta 3 (TGF-beta 3) sequence including all of the mature sequence. Clone hu4 was isolated from a human ovarian cDNA library using porcine TGF-beta 3 cDNA (see AAV52934) as probe. The invention relates to the recombinant production of TGF-beta. Biologically active TGF-beta is defined as being capable of inducing EGF-potentiated anchorage independent growth of target cell lines and/or growth inhibition of neoplastic cell lines. Nucleic acids encoding TGF-beta have been isolated and cloned into
                                                                                                                                                                                                                                                                                                                                     הוא פונטטווס transforming growth factor-beta precursor sequence -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   à
```

```
Nucleotide sequence encoding transforming growth factor beta-3 -used as a probe, or to produce TGF beta 3, for inhibition of growth of normal and neoplastic cells, eg A549.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence encodes human transforming growth factor-beta 3 (TGF-beta 3) polypeptide. The nucleic acid sequence encoding this subtype is useful as a probe or to produce TGF-beta 3 for both normal and neoplastic cell growth inhibition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       gtgctgggactgtacaacactctgaaccctgaagcatctgcctcgccttgctgcgtgccc 240

                This sequence has been compiled from the description of a mutant TGF-beta3 contained in the claims. The sequence coding for the Factor Xa cleavage site may be replaced by one encoding a similar procease recognition site, e.g. for collagenase. The coding sequence may also include a region encoding a hydrophobic transmembrane amino acid sequence. e.g. from c-ebbB2 cDNA and a "stop transfer" sequence. The protease recognition site is located between the C-terminal of the transmembrane region and the N-terminal of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                   The sequence encodes a 112 amino acid tumor growth inhibitor (TGI)

(AAR86770) or a 205 precursor TGI (AAR86771) comprising TGI with an additional 93 amino acid residues at the N-terninus. However, the nuclectides representing codons -40 to -10 f the precursor TGI are not specified in Figure 29, i.e. the cDNA is 498 nucleotides in length, but should be 615 nucleotides long. The DNA is used to produce the inhibitors by recombinant methods i.e. vector expression in bacterium or eukaryotic host cells, e.g. carcinoma, melanoma or leukaemia cells, in the treatment of proliferative disorders e.g. arteriosclerosis, inflammation and composition of the treatment of burns to facilitate wound healing. They can also be used as immunomodulators. Although the proteins proteins are not rensiforming growth factor-beta-1 or -beta-2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The plasmid was isolated from a human cDNA library prepd. from the DNA of a chronic myelocytic leukaemia cell line (K562). The sequence can be used to produce the tumour growth inhibitor (TGI) by recombinant techniques. The protein may also be isolated from human umbilical cord and placental tissues. It can be used to inhibit tumour cell growth, to treat burns, to facilitate the healing of wounds or to treat proliferative disorders. The protein and Abs raised to it can be used for detection and typing of tumours. The Abs can also be used to inhibit the activity of

                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                     Nucleotide sequence encoding transforming growth factor beta-3 -used as a probe, or to produce TGF beta 3, for inhibition of growth of normal and neoplastic cells, eg A549.
                                                                                                                                                                                                                                                                                                                This sequence encodes porcine transforming growth factor-beta 3 (TGF-beta 3) polypeptide. The nucleic acid sequence encoding this subtype is useful as a probe or to produce TGF-beta 3 for both normal and neoplastic cell growth inhibition.

transforming growth factor beta 3 precursor (prefer-beta 3, see AAW78786). A porcine ovarian cDNA library was screened using human of Gre-beta 1 cDNA (see AAV52933) as probe. A hybridising clone, cosignated lambda 11.3, was used to rescreen the library to designated lambda 10. The was combined with clone lambda 11.3 combined with clone lambda 11.3 combined to provide the 10+11.3 sequence. The invention relates to the recombinant production of TGF-beta. Biologically active TGF-beta is defined as being capable of inducing EGF-potentiated anchorage independent growth of target cell lines and/or growth inhibition of coplastic cell lines. Nucleic acids encoding TGF-beta have been isolated and cloned into vectors which are replicated in bacteria cand expressed in cukaryotic cells. TGF-beta recovered from transformed cells is used in known therapeutic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA encoding transforming growth factor-beta precursor sequence - useful for analysis to perform manipulations to increase yield of recombinant production of the protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This nucleotide sequence, termed 10+11.3, codes for the porcine

A genomic fragment corresponding to a human TGF-beta-1 exon (AAQ56924) was also isolated and its amino acid sequence determined (AAR46230). The sequences have been used in the construction of vectors for the expression of recombinant TGF-

of the human isoforms TGF-betal, TGF-beta2 and TGF-beta3 (see AAQ41599, AAQ41601 and AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. Of the 30 possible hybrids using these hinge points and one part each from two of the isoforms, 6 are preferred including the hybrid TGF-betal(44/45)beta3. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue. See AAQ41602-Q41607 for the most pref. hybrids.

                                                              A DNA sequence (AAT17237) codes for a recombinant hybrid of human transforming growth factor-beta, TGF-beta 1-3 (AAR92775), in which the N-terminal 44 amino acids are from TGF-beta 1 (see also AAR92773) and the C-terminal 68 amino acids from TGF-beta 3 (see also AAR92773). The DNA was subcloned in pPLMu, yielding plasmid pPLMu, hTGF-beta 1(44/45)beta3. Non-soluble, monomeric hybrid TGF-beta 1-3 was recovered from E. coll transformants. A blologically active, dimeric form of the hybrid was obtd. by refolding the monomer in detergent-free buffer contq. DNSO and/or DNF. Hybrid dimers TGF-beta 2-3 (AAR92776) and TGF-beta 3-2 (AAR927777) were similarly
                                                                                                                                                                                                                                                                                               240

AATIS465 encodes transforming growth factor (TGF) beta-like protein, TGF-beta-1-3. TGF beta-1-3 is a hybrid of TGF-1 and TGF-3. TGF beta hybrids were made using a new process of producing dimeric, biologically active TGF beta-like proteins. The new process involves treating denatured TGF beta monomers with folding buffer contg. a mild detergent (CHAPS, CHAPSO or digitonin) and at least one of the solvents DMSO (dimethyl sulphoxida), DMSO2 (dimethylsulphoxe) and DMF (dimethyl formamide). The detergent allows folding of the monomer such that, after dimerisation, the TGF beta-like protein retains biological activity and remains in soluble form. The method allows relatively high yields of biologically active TGF beta-like proteins in thair native dimeric form. TGF-beta like proteins are multifunctional regulators of cellular activity and a typical use is to stimulate wound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240

The specification describes a method for growing stem cells. The method involves providing stem cells with supporters which are genetically modified in order to provide externally regulatable interactions between the supporters and the stem cells, and applying an external signal for starting or stopping the interactions. The cells are useful for curing diseases by gene therapy and/or cell therapy in combination with tissue engineering, when the functional expression of stem cells is helped with engineered architecture of the tissue, which diseases are related to insufficient and/or lack and/or disorders of stem cells. The present sequence represents a vector, which is used in the method of the

The invention covers hybrid TGF-beta molecules consisting of parts of the human isoforms TGF-beta1, TGF-beta2 and TGF-beta3 (see AAQ41599, AAQ41600 and AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. Of the 30 possible hybrids using these hinge points and one part each from two of the isoforms, 6 are preferred including the hybrid TGF-beta2(44/45)beta3. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        tacattgacttccgacaggatctgggctggaagtgggtccatgaacctaagggctactat 120

                                                                                               A DNA sequence (AAT17238) codes for a recombinant hybrid of human transforming growth factor-beta, TGF-beta 2-3 (AAR92776), in which the N'terminal 44 amino acids are from TGF-beta 2 (see also AAR92774). The DNA was subcloned in pPLMu, yielding plasmid pPLMu.hTGF-beta 2 (44/45)beta3. Non-soluble, monomeric hybrid TGF-beta 1-3 was recovered from E. coli LC137 transformants. A biologically active, dimeric form of the hybrid was obtd. by refolding the monomer in detergent-free buffer contg. DMSO and/or DMF. Hybrid dimers TGF-beta 1-3 (AAR92775) were similarly

                                                                                                                                                                                                                               ;
0
                   AAT15466 encodes transforming growth factor (TGF) beta-like protein, TGF-beta-2-3. TGF beta-2-3 is a hybrid of TGF-2 and TGF-3. TGF beta hybrids were made using a new process of producing dimeric, biologically active TGF beta-like proteins. The new process involves treating denatured TGF beta monomers with folding buffer contg. a mild detergent (CHAPS, CHAPSO or digitonin) and at least one of the solvents DMSO (dimethyl sulphoxide), DMSO2 (dimethylsulphone) and DMF (dimethyl formamide). The detergent allows folding of the monomer such that, after dimerisation, the TGF beta-like protein retains biological activity and remains in soluble form. The method allows relatively high yields of biologically active TGF beta-like proteins in their native dimeris form. TGF-beta like proteins are multifunctional requiators of cellular activity and a typical use is to stimulate wound

The invention covers hybrid TGF-beta molecules consisting of parts of the human isoforms TGF-beta1 (see AAQ41599, AAQ41600 and AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids to possible hybrids using these hinge points and one part each possible hybrids using these hinge points and one part each from two of the isoforms, 6 are preferred including the hybrid TGF-beta3(44/45)beta1. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention covers hybrid TGF-beta molecules consisting of parts AAQ41600 and AAQ41601, respectively. The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. Of the 30 possible hybrids using these hinge points and one part each from two of the isoforms, 6 are preferred, esp. the hybrid TGF-beta3(44/45)beta2. The hybrid molecules promote cell migration, inhibit the growth of A375 melanown cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue.

See AAQ41602-Q41606 for the other pref. hybrids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240

A DNA sequence (AAT17239) codes for a recombinant hybrid of human transforming growth factor-beta, TGF-beta 3-2 (AAR92777), in which the N-terminal 44 amino acids are from TGF-beta 3 (see also AAR92772) and the C-terminal 68 amino acids from TGF-beta 2 (see also AAR92774). The DNA was subcloned in pPLMu, yielding plasmid pPLMu.hTGF-beta 3 (44/45)beta2. Non-soluble, monomeric hybrid TGF-beta 3-2 was recovered from E. coll LC137 transformants. A biologically active, dimeric form of the hybrid was obtd. by refolding the monomer in detergent-free buffer contg. DNSO and/or DNF. Hybrid dimers TGF-beta 1-3 (AAR92775) and TGF-beta 2-3 (AAR92776) were similarly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180

AATIS467 encodes transforming growth factor (TGF) beta-like protein, TGF-beta-3-2. TGF beta-3-2 is a hybrid of TGF-3 and TGF-2. TGF beta hybrids were made using a new process of producing dimeric, biologically active TGF beta-like proteins. The new process involves treating denatured TGF beta-like proteins. The new process involves treating denatured TGF beta-nonears with folding buffer conty. a mild detergent (CHAPS, CHAPSO or digitonin) and at least one of the solvents DMSO (dimethyl sulphoxidal, DMSO) (dimethylsulphone) and DMF (dimethyl formamide). The detergent allows folding of the monomer such that, after dimerisation, the TGF beta-like protein retains biological activity and remains in soluble form. The method allows relatively high yields of biologically active TGF beta-like proteins in their native dimeric form. TGF-beta like proteins are multifunctional regulators of cellular activity and a typical use is to stimulate wound
factor
                                                                                                                                                                                                                                                                                                                                                                                                                   of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δ
                                                                                                                                                                                                          comprises a purification tray and a TGF active fragment. The present sequence encodes a specifically claimed TGF active fragment, TGF-betal. Additionally, the fusion protein may comprise proteinse-sensitive additionally, the fusion protein may comprise proteinse-sensitive inher sites and binding domain so the protein sequence may contain some or all of the following elements: purification tag:proteinase site:TGF-beta. TGF-beta promotes site:ECM binding site:proteinase site:TGF-beta. TGF-beta promotes wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the fusion protein. The proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the TGF-beta to the site to be treated reduces the amount of TGF-beta required to be administered to be effective and reduces the concentration of circulating TGF-beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Proteinase site; bone morphogenetic fusion protein; bone binding site; bone morphogenetic protein; transforming growth factor beta; active fragment; wound healing; bone growth; purification tag; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         300
